

Using Imperative way (Create): Using this way we can run our command via single line. It is used for testing purpose. It is where you issue a command and get an immediate output.

Example: `kubectl create deployment my-deploy --image nginx`

Using Declarative way (Apply): Using this way we create a file in which commands are mentioned, and these commands are run in interpreted manner. Declarative management is only available when you're using YAML config files. you use the single apply command.

Using Generators (Run, Expose): Generators are kubectl commands that generate resources based on a set of inputs
